

OE3C: Keynote Speakers

Ecology

Dr. Jesse Popp

University of Guelph,
Ontario

Canada Research Chair in Indigenous Environmental Science.

Part of the Wiikwemkoong Unceded Territory with Anishinaabe and mixed European heritage, she promotes inclusive science. She aims to weave Indigenous and Western knowledge systems to contribute to the advancement of environmental and ecological science.

Ethology

Dr. Mélanie Guigueno

McGill University,
Ontario

Examines natural behaviour in natural settings and examines links between behaviour, cognition, and the brain. As part of her research, she studies avian brood parasitism, in which some parasitic species show female-biased sex differences in spatial behaviour in the field with associated sex differences in spatial memory and in the hippocampus.

Evolution

Dr. Nancy Chen

University of California,
Los Angeles

She focuses on the genomic basis of contemporary evolution in natural populations. Her research integrates genomics and long-term demographic studies to characterize the evolutionary processes of variation across the genome through and link genetic variation to variation in individual phenotypes, fitness, and eventually population dynamics.
